Chapter 13: Programming Multi-Agent Systems
Rafael H. Bordini and Jürgen Dix

Multi-Agent Systems, edited by Gerhard Weiss
MIT Press, May 2012
Time

**Duration:** The course can be divided into 4 lectures à 60 minutes:

Course type

**Level:** advanced

**Prerequisites:**

Course website

http://mitpress.mit.edu/multiagentsystems
Course Overview

The course can be divided into 4 lectures à 60 minutes:

Lec. 1: History and the MAOP Paradigm
Lec. 2: Examples of Programming Languages
Lec. 3: Organisation and Environment Programming
Lec. 4: An Example in JaCoMo
Reading Material I

Reading Material II

Rafael H. Bordini, Mehdi Dastani, Jürgen Dix, and Amal El Fallah-Seghrouchni, editors,

*Multi-agent Programming: Languages, Platforms and Applications.*

Rafael H. Bordini, Jomi F. Hübner, and Michael Wooldridge.

*Programming Multi-Agent Systems in AgentSpeak Using Jason.*
Outline

1. History and the MAOP Paradigm
2. Examples of Programming Languages
3. Organisation and Environment Programming
4. An Example in JACAMO
5. References
1. History and the MAOP Paradigm

- Agent Level
- Environment Level
- Social Level
Agent-oriented programming started with Shoham in 1993.
Agent-oriented programming started with Shoham in 1993.

While the first decade saw mainly theoretical approaches, the creation of the ProMAS and DALT workshop series (both held with AAMAS since 2003) and related activity helped to change the picture.
Agent-oriented programming started with Shoham in 1993.

While the first decade saw mainly theoretical approaches, the creation of the ProMAS and DALT workshop series (both held with AAMAS since 2003) and related activity helped to change the picture.

The first agent programming languages were mostly concerned with programming individual agents: no abstractions covering the social and environmental dimensions.
Mature Languages

- Usable **IDEs** and **debugging tools** (in particular tools to inspect the state of an agent or an organisation).
Mature Languages

- Usable IDEs and debugging tools (in particular tools to inspect the state of an agent or an organisation).
- Still a long way to go compared to the best tools used for object-oriented programming.
Mature Languages

- Usable IDEs and debugging tools (in particular tools to inspect the state of an agent or an organisation).
- Still a long way to go compared to the best tools used for object-oriented programming.
- Inspiration comes from reactive planning systems [Georgeff and Lansky, 1987] and the societal view of computing.
Ongoing research

- Proceedings of ProMAS [Collier et al., 2011],
- proceedings of DALT [Omicini et al., 2011],
- CLIMA, AAMAS (as well as the main AI conferences),
- LADS [Dastani et al., 2010] and various other workshops.
Survey papers

- [Fisher et al., 2007, Bordini et al., 2006, Mascardi et al., 2004, Dastani and Gómez-Sanz, 2005]
- [Bordini et al., 2011, Bordini et al., 2007a].
Reacting to Events × Long-Term Goals

- Autonomous agents have to be attentive to changes and react to them appropriately as former goals may not succeed.
Reacting to Events × Long-Term Goals

- Autonomous agents have to be **attentive** to changes and react to them appropriately as former goals may not succeed.

- **Long-term goals** have to be taken into account.
Reacting to Events × Long-Term Goals

- Autonomous agents have to be **attentive** to changes and react to them appropriately as former goals may not succeed.
- **Long-term goals** have to be taken into account.
- In **highly dynamic environments**, not reacting to events means losing opportunities for the agent to achieve what is expected of it.
Courses of Action Depend on Circumstances

Agents will be **constantly deciding** which courses of action to take in order to react to events.
Courses of Action Depend on Circumstances

- Agents will be **constantly deciding** which courses of action to take in order to react to events.
- This decision depends on the **current circumstances** (of the agent, other agents, the environment, etc.).
Courses of Action Depend on Circumstances

- Agents will be **constantly deciding** which courses of action to take in order to react to events.
- This decision depends on the **current circumstances** (of the agent, other agents, the environment, etc.).
- The agent will use its most up-to-date information about the state of itself, other agents, and the environment in order to **decide at runtime** what needs to be done.
Choosing Courses of Action only When About to Act

Due to the highly dynamic nature, the course of action to be used should **not be decided too early**: things might have changed by the time the agent is actually about to act.
Choosing Courses of Action only When About to Act

- Due to the highly dynamic nature, the course of action to be used should not be decided too early: things might have changed by the time the agent is actually about to act.

- Agent languages often use partially instantiated plans so that not only details of a plan but the particular (sub)plan to be used for each (sub)goal is only chosen when the agent is about to act on achieving a particular goal.
Dealing with Plan Failure

- Even **delaying the decision** on particular courses of action might not be enough to ensure that the agent has chosen a suitable course of action in a dynamic environment.
Dealing with Plan Failure

- Even **delaying the decision** on particular courses of action might not be enough to ensure that the agent has chosen a suitable course of action in a dynamic environment.

- While **executing** a plan, the agent may realise a failure has occurred, so agent languages still need to provide mechanisms to deal with **plan failure**.
Rational Behaviour

- Agent applications will require that agents behave rationally.
Rational Behaviour

- Agent applications will require that agents behave rationally.
- BDI literature [Rao and Georgeff, 1995] has pointed to very concrete aspects of rationality.
Rational Behaviour

- Agent applications will require that agents behave rationally.
- BDI literature [Rao and Georgeff, 1995] has pointed to very concrete aspects of rationality.
- If an agent has an intention (i.e. is committed to the goal of achieving a particular state of affairs) we expect it to reason about how to achieve that intention.
Rational Behaviour

- Agent applications will require that agents behave rationally.
- BDI literature [Rao and Georgeff, 1995] has pointed to very concrete aspects of rationality.
- If an agent has an intention (i.e. is committed to the goal of achieving a particular state of affairs) we expect it to reason about how to achieve that intention.
- We do not expect the agent to give up before the intention is believed to have been effectively achieved, unless there is good reason to believe it will not be possible to achieve it at all.
Social Ability – High-Level Communication, Organisation

- Essential feature: some tasks are only possible if agents interact.
Social Ability – High-Level Communication, Organisation

- Essential feature: some tasks are only possible if agents interact.
- In order to cooperate or to coordinate their action, agents typically use a high-level form of communication based on the idea of speech-acts [Austin, 1962, Searle, 1969].
Social Ability – High-Level Communication, Organisation

- Essential feature: some tasks are only possible if agents interact.
- In order to cooperate or to coordinate their action, agents typically use a high-level form of communication based on the idea of speech-acts [Austin, 1962, Searle, 1969].
- Agents can be programmed to take part in an agent organisation all within the context of multiagent oriented programming.
Code Modification at Runtime

Platforms for MAP allow for simple changing the system program at runtime.
Code Modification at Runtime

- Platforms for MAP allow for simple changing the system program at runtime.
- Plan libraries can be changed at runtime, and so does the behaviour of the agent.
Code Modification at Runtime

- Platforms for MAP allow for simple changing the system program at runtime.
- Plan libraries can be changed at runtime, and so does the behaviour of the agent.
- Often this is done through speech-act based communication: not only other agents but humans as well can communicate new plans (i.e. know-how or behaviour) for the agents.
- In some platforms for agent organisations the specification of the social structure and overall social plan and norms that agents ought to follow can be changed on-the-fly.
1.1 Agent Level
General Abstractions

MAOP provides abstractions to facilitate the development of software that is both autonomous and social.
General Abstractions

- MAOP provides abstractions to facilitate the development of software that is both autonomous and social.
- belief is an abstraction of the agent’s informational state.
General Abstractions

- MAOP provides abstractions to facilitate the development of software that is both autonomous and social.
- belief is an abstraction of the agent’s informational state.
- Agents need to be able not just to represent beliefs but to continuously update them.
General Abstractions

- MAOP provides abstractions to facilitate the development of software that is both autonomous and social.
- belief is an abstraction of the agent’s informational state.
- Agents need to be able not just to represent beliefs but to continuously update them.
- Perhaps the most important abstraction in agent programming is that of a goal.
General Abstractions

- MAOP provides abstractions to facilitate the development of software that is both autonomous and social.
- belief is an abstraction of the agent’s informational state.
- Agents need to be able not just to represent beliefs but to continuously update them.
- Perhaps the most important abstraction in agent programming is that of a goal.
- A goal is typically represented as a property that is currently not believed to be true and that will lead the agent into action in order to make that property true.
Declarative achievement goal

The agent wishes to bring about a certain state of affairs which it currently believes not to hold and is willing to commit itself to acting so as to bring about such state of affairs: **Declarative achievement goal.**
Declarative achievement goal

- The agent wishes to bring about a certain state of affairs which it currently believes not to hold and is willing to commit itself to acting so as to bring about such state of affairs: Declarative achievement goal.

- Such goals facilitate the programming of software that can appear to be pro-active as well as recovering from failure due to a quickly changing environment.
Declarative achievement goal

- The agent wishes to bring about a certain state of affairs which it currently believes not to hold and is willing to commit itself to acting so as to bring about such state of affairs: **Declarative achievement goal**.

- Such goals facilitate the programming of software that can appear to be pro-active as well as recovering from failure due to a quickly changing environment.

- One of the first comprehensive typologies for goals in agent programming was published in [Braubach et al., 2004], with much work following it, in [van Riemsdijk et al., 2005].
Plans and Intentions

- A **plan** is a course of action that under specific circumstances might help the agent handle a particular event (achieving a long-term goal or reacting to changes in beliefs, for example about the environment).
Plans and Intentions

- A **plan** is a course of action that under specific circumstances might help the agent handle a particular event (achieving a long-term goal or reacting to changes in beliefs, for example about the environment).

- An **intention** is an instance of a plan that has been chosen to handle a particular event and has been partially instantiated with information about the event.
Plans and Intentions

- A **plan** is a course of action that under specific circumstances might help the agent handle a particular event (achieving a long-term goal or reacting to changes in beliefs, for example about the environment).

- An **intention** is an instance of a plan that has been chosen to handle a particular event and has been partially instantiated with information about the event.

- This **intended means** may contain further goals to achieve.
Plans and Intentions

- A **plan** is a course of action that under specific circumstances might help the agent handle a particular event (achieving a long-term goal or reacting to changes in beliefs, for example about the environment).
- An **intention** is an instance of a plan that has been chosen to handle a particular event and has been partially instantiated with information about the event.
- This **intended means** may contain further goals to achieve.
- The agent uses information as up-to-date as possible when committing to particular means to achieve its goals.
1.2 Environment Level
A typical abstraction at the environment level is that of an artifac\textsuperscript{†}: a non-autonomous, non-proactive entity which however is not an object in object orientation.
A typical abstraction at the environment level is that of an artifact: a non-autonomous, non-proactive entity which however is not an object in object orientation.

An artifact transparently encapsulates two other important abstractions connecting agents and their environment: actions and percepts.
A typical abstraction at the environment level is that of an artifact: a non-autonomous, non-proactive entity which however is not an object in object orientation.

An artifact transparently encapsulates two other important abstractions connecting agents and their environment: actions and percepts.

Artifacts can be used to transparently give agents access to software services. They can also be used to create a model of a real-world environment.
1.3 Social Level
Organisations, obligations, norms

An agent **organisation** typically has a **structure**, possibly hierarchical, formed by **groups** of agents, where individual agents might play specific **roles**.
Organisations, obligations, norms

- An agent organisation typically has a structure, possibly hierarchical, formed by groups of agents, where individual agents might play specific roles.

- If an agent autonomously chooses to adopt a specific role in an agent organisation, it will commit to specific obligations that the organisation expects of agents playing that role.
Organisations, obligations, norms

- An agent organisation typically has a structure, possibly hierarchical, formed by groups of agents, where individual agents might play specific roles.

- If an agent autonomously choses to adopt a specific role in an agent organisation, it will commit to specific obligations that the organisation expect of agents playing that role.

- Such obligations, prohibitions, and permissions are specified by means of social norms.
Organisations, obligations, norms II

- Norms can be enforced by *regimentation*, i.e. the system prevents the violation of the norm to even take place, or *sanctions* might be specified so as to punish agents that do not comply with particular norms.
Organisations, obligations, norms II

- Norms can be enforced by *regimentation*, i.e. the system prevents the violation of the norm to even take place, or *sanctions* might be specified so as to punish agents that do not comply with particular norms.

- *Social plans* can be used to explicitly represent the specific subgoals that each agent in a group is expected to achieve in order for a task that requires the joint work of a team of agents to be accomplished.
2. Examples of Programming Languages

- JASON
- Other BDI-Based Languages
- Approaches based on executable logics
Overview

- We focus here on individual agent programs.
- We present mainly JASON and mention in passing a few other languages.
2.1 JASON
AgentSpeak

- Originally proposed by Rao [Rao, 1996]
AgentSpeak

- Originally proposed by Rao [Rao, 1996]
- Programming language for BDI agents
AgentSpeak

- Originally proposed by Rao [Rao, 1996]
- Programming language for BDI agents
- Elegant notation, based on logic programming
AgentSpeak

- Originally proposed by Rao [Rao, 1996]
- Programming language for BDI agents
- Elegant notation, based on logic programming
- Inspired by PRS (Georgeff & Lansky), dMARS (Kinny), and BDI Logics (Rao & Georgeff)
AgentSpeak

- Originally proposed by Rao [Rao, 1996]
- Programming language for BDI agents
- Elegant notation, based on logic programming
- Inspired by PRS (Georgeff & Lansky), dMARS (Kinny), and BDI Logics (Rao & Georgeff)
- Abstract programming language aimed at theoretical results
JASON implements the operational semantics of a variant of AgentSpeak
JASON implements the **operational semantics** of a variant of AgentSpeak

Has various extensions aimed at a more **practical** programming language (e.g. definition of the MAS, communication, ...)
JASON implements the **operational semantics** of a variant of AgentSpeak

- Has various extensions aimed at a more **practical** programming language (e.g. definition of the MAS, communication, ...)
- Highly customised to simplify **extension** and experimentation
JASON implements the operational semantics of a variant of AgentSpeak

Has various extensions aimed at a more practical programming language (e.g. definition of the MAS, communication, ...)

Highly customised to simplify extension and experimentation

Developed by Jomi F. Hübner and Rafael H. Bordini
Main Language Constructs and Runtime Structures

**Beliefs:** represent the information available to an agent (e.g. about the environment or other agents)
Main Language Constructs and Runtime Structures

**Beliefs:** represent the **information available** to an agent (e.g. about the environment or other agents)

**Goals:** represent **states of affairs** the agent wants to bring about
Main Language Constructs and Runtime Structures

**Beliefs:** represent the *information available* to an agent (e.g. about the environment or other agents)

**Goals:** represent *states of affairs* the agent wants to bring about

**Plans:** are recipes for action, representing the *agent’s know-how*
Main Language Constructs and Runtime Structures

**Beliefs:** represent the *information available* to an agent (e.g. about the environment or other agents)

**Goals:** represent *states of affairs* the agent wants to bring about

**Plans:** are recipes for action, representing the *agent’s know-how*

**Events:** happen as *consequence to changes* in the agent’s beliefs or goals
Main Language Constructs and Runtime Structures

**Beliefs:** represent the information available to an agent (e.g. about the environment or other agents)

**Goals:** represent states of affairs the agent wants to bring about

**Plans:** are recipes for action, representing the agent’s know-how

**Events:** happen as consequence to changes in the agent’s beliefs or goals

**Intentions:** plans instantiated to achieve some goal
Main Architectural Components

Belief base: where beliefs are stored
Main Architectural Components

**Belief base:** where beliefs are stored

**Set of events:** to keep track of events the agent will have to handle
Main Architectural Components

Belief base: where beliefs are stored

Set of events: to keep track of events the agent will have to handle

Plan library: stores all the plans currently known by the agent
Main Architectural Components

Belief base: where beliefs are stored

Set of events: to keep track of events the agent will have to handle

Plan library: stores all the plans currently known by the agent

Set of Intentions: each intention keeps track of the goals the agent is committed to and the courses of action it chose in order to achieve the goals for one of various foci of attention the agent might have
**JASON Interpreter**

- perceive the environment and update belief base
JASON Interpreter

- perceive the environment and update belief base
- process new messages
JASON Interpreter

- perceive the environment and update belief base
- process new messages
- select event
JASON Interpreter

- perceive the environment and update belief base
- process new messages
- select event
- select relevant plans
JASON Interpreter

- perceive the environment and update belief base
- process new messages
- select event
- select relevant plans
- select applicable plans
JASON Interpreter

- perceive the environment and update belief base
- process new messages
- select event
- select relevant plans
- select applicable plans
- create/update intention
JASON Interpreter

- perceive the environment and update belief base
- process new messages
- select event
- select relevant plans
- select applicable plans
- create/update intention
- select intention to execute
2 Examples of Programming Languages

2.1 JASON

JASON Re reasoning Cycle

Graphical representation of the JASON reasoning cycle with various nodes and arrows indicating the flow of information and actions.
Beliefs — Representation

Syntax

Beliefs are represented by annotated literals of first order logic

\[
\text{functor}(term_1, \ldots, term_n)[annot_1, \ldots, annot_m]
\]

Example 2.1 (belief base of agent Tom)

\[
\text{red(box1)}[\text{source(percept)}].
\text{friend(bob,alice)}[\text{source(bob)}].
\text{lier(alice)}[\text{source(self)}, \text{source(bob)}].
\sim \text{lier(bob)}[\text{source(self)}].
\]
Beliefs — Dynamics

By perception

beliefs annotated with source(percept) are automatically updated accordingly to the perception of the agent

By intention

the plan operators + and - can be used to add and remove beliefs annotated with source(self) (mental notes)

+lier(alice); // adds lier(alice)[source(self)]
-lier(john); // removes lier(john)[source(self)]
Beliefs — Dynamics II

By communication

when an agent receives a **tell** message, the content is a new belief annotated with the sender of the message

```plaintext
.send(tom,tell,lier(alice)); // sent by bob
// adds lier(alice)[source(bob)] in Tom’s BB
...
.send(tom,untell,lier(alice)); // sent by bob
// removes lier(alice)[source(bob)] from Tom’s BB
```
Goals — Representation

Types of goals

- Achievement goal: goal to do
- Test goal: goal to know

Syntax

Goals have the same syntax as beliefs, but are prefixed by ! (achievement goal) or ? (test goal)
Example 2.2 (Initial goal of agent Tom)

!write(book).
Goals — Dynamics

by intention

the **plan operators** ! and ? can be used to add a new goal annotated with `source(self)`

```plaintext
...
// adds new achievement goal !write(book)[source(self)]
!write(book);

// adds new test goal ?publisher(P)[source(self)]
?publisher(P);
...
```
Goals — Dynamics II

By communication – achievement goal

when an agent receives an **achieve** message, the content is a new achievement goal annotated with the sender of the message

```plaintext
.send(tom,achieve,write(book)); // sent by Bob
// adds new goal write(book)[source(bob)] for Tom
...
.send(tom,unachieve,write(book)); // sent by Bob
// removes goal write(book)[source(bob)] for Tom
```
Goals — Dynamics III

By communication – test goal

when an agent receives an askOne or askAll message, the content is a new test goal annotated with the sender of the message

```
.send(tom,askOne,published(P),Answer); // sent by Bob
// adds new goal ?publisher(P)[source(bob)] for Tom
// the response of Tom will unify with Answer
```
Triggering Events — Representation

- Events happen as consequence to changes in the agent’s beliefs or goals
- An agent reacts to events by executing plans
- Types of plan triggering events
  +b (belief addition)
  -b (belief deletion)
  +!g (achievement-goal addition)
  -!g (achievement-goal deletion)
  +?g (test-goal addition)
  -?g (test-goal deletion)
An AgentSpeak plan has the following general structure:

\[ \text{triggering\_event : context } <- \text{ body.} \]

where:

- the triggering event denotes the events that the plan is meant to handle
- the context represent the circumstances in which the plan can be used
- the body is the course of action to be used to handle the event if the context is believed true at the time a plan is being chosen to handle the event
Plans — Operators for Plan Context

Boolean operators

\& (and)

| (or)

not (not)

= (unification)

>, >= (relational)

<, <= (relational)

== (equals)

\== (different)

Arithmetic operators

+ (sum)

- (subtraction)

* (multiply)

/ (divide)

div (divide – integer)

mod (remainder)

** (power)
Plans — Operators for Plan Body

A plan body may contain:

- Belief operators (+, -, -+)
- Goal operators (!, ?, !!)
- Actions (internal/external) and Constraints
Example 2.3 (plan body)

```plaintext
+rain : time_to_leave(T) & clock.now(H) & H >= T
<- !g1;       // new sub-goal
!!g2;         // new goal
?qb(X);       // new test goal
+b1(T-H);     // add mental note
-b2(T-H);     // remove mental note
+-b3(T*H);    // update mental note
jia.get(X);   // internal action
X > 10;       // constraint to carry on
close(door).  // external action
```
# Plans — Example

```
+green_patch(Rock) [source(percept)]
    : not battery_charge(low)
<- ?location(Rock,Coordinates);
   !at(Coordinates);
   !examine(Rock).

+!at(Coords)
    : not at(Coords) & safe_path(Coords)
<- move_towards(Coords);
   !at(Coords).

+!at(Coords)
    : not at(Coords) & not safe_path(Coords)
<- ...

+!at(Coords) : at(Coords).
```
Plans — Dynamics

The plans that form the plan library of the agent come from

- initial plans defined by the programmer
Plans — Dynamics

The plans that form the plan library of the agent come from

- initial plans defined by the programmer
- plans added dynamically and intentionally by
  - .add_plan
  - .remove_plan
Plans — Dynamics

The plans that form the plan library of the agent come from

- initial plans defined by the programmer
- plans added dynamically and intentionally by
  - .add_plan
  - .remove_plan
- plans received from
  - tellHow messages
  - untellHow
Strong Negation

Example 2.4

```plaintext
+!leave(home)
  :  ~raining
  <- open(curtains); ...

+!leave(home)
  : not raining & not ~raining
  <- .send(mum,askOne,raining,Answer,3000); ...
```
Prolog-like Rules in the Belief Base

Example 2.5

likely_color(Obj,C) :-
    colour(Obj,C)[degOfCert(D1)] &
    not (colour(Obj,_) [degOfCert(D2)] & D2 > D1) &
    not ~colour(C,B).
Plan Annotations

- Like beliefs, plans can also have **annotations**, which go in the plan **label**
Plan Annotations

- Like beliefs, plans can also have annotations, which go in the plan label.
- Annotations contain meta-level information for the plan, which selection functions can take into consideration.
Plan Annotations

- Like beliefs, plans can also have **annotations**, which go in the plan **label**
- Annotations contain meta-level information for the plan, which selection functions can take into consideration
- The annotations in an intended plan instance can be changed **dynamically** (e.g. to change intention priorities)
Plan Annotations

- Like beliefs, plans can also have annotations, which go in the plan label.
- Annotations contain meta-level information for the plan, which selection functions can take into consideration.
- The annotations in an intended plan instance can be changed dynamically (e.g. to change intention priorities).
- There are some pre-defined plan annotations, e.g. to force a breakpoint at that plan or to make the whole plan execute atomically.
Plan Annotations II

Example 2.6 (an annotated plan)

@myPlan[\text{chance\_of\_success}(0.3), \text{usual\_payoff}(0.9), 
\text{any\_other\_property}]

+!g(X) : c(t) \leftarrow a(X).
Failure Handling: Contingency Plans

Example 2.7 (an agent blindly committed to $g$)

\begin{align*}
+!g & : \quad g. \\
+!g & : \quad \ldots \quad \leftarrow \quad \ldots \quad ?g. \\
-!g & : \quad \text{true} \quad \leftarrow \quad !g.
\end{align*}
Higher-Order Variables

Example 2.8 (an agent that asks for plans on demand)

\[-!G[\text{error(no_relevant)}] : \text{teacher}(T)\]
\[
<- .\text{send}(T, \text{askHow}, \{ +!G \}, \text{Plans});
 .\text{add_plan}(\text{Plans});
 !G.
\]

in the event of a failure to achieve any goal $G$ due to no relevant plan, asks a teacher for plans to achieve $G$ and then try $G$ again
Higher-Order Variables II

- The failure event is annotated with the error type, line, source, ...
  \texttt{error(no\_relevant)} means no plan in the agent’s plan library to achieve $G$

- \{ +!G \} is the syntax to enclose triggers/plans as terms
Internal Actions

- Unlike actions, internal actions do not change the environment
Internal Actions

- Unlike actions, internal actions do not change the environment.
- Code to be executed as part of the agent reasoning cycle.
Internal Actions

- Unlike actions, internal actions do not change the environment
- Code to be executed as part of the agent reasoning cycle
- AgentSpeak is meant as a high-level language for the agent’s practical reasoning and internal actions can be used for invoking legacy code elegantly
Internal Actions

- Unlike actions, internal actions do not change the environment.
- Code to be executed as part of the agent reasoning cycle.
- AgentSpeak is meant as a high-level language for the agent’s practical reasoning and internal actions can be used for invoking legacy code elegantly.

- Internal actions can be defined by the user in Java:

  \[ \text{libname.action\_name(...)} \]
Standard Internal Actions

- Standard (pre-defined) internal actions have an empty library name
  - `.print(term_1, term_2, ...)`
  - `.union(list_1, list_2, list_3)`
  - `.my_name(var)`
  - `.send(ag, perf, literal)`
  - `.intend(literal)`
  - `.drop_intention(literal)`

Many others available for: printing, sorting, list/string operations, manipulating the beliefs/annotations/plan library, creating agents, waiting/generating events, etc.
Standard Internal Actions

- Standard (pre-defined) internal actions have an empty library name
  - `.print(term_1, term_2, ...)`
  - `.union(list_1, list_2, list_3)`
  - `.my_name(var)`
  - `.send(ag, perf, literal)`
  - `.intend(literal)`
  - `.drop_intention(literal)`

- Many others available for: printing, sorting, list/string operations, manipulating the beliefs/annotations/plan library, creating agents, waiting/generating events, etc.
Suspending and Resuming Intentions

Example 2.9 (JASON code with meta-events)

+see(gold)
  <- !goto(gold).
+!goto(gold) : see(gold)     // long term goal
  <- !select_direction(A);
      go(A);
      !goto(gold).
+battery(low)                  // reactivity
  <- !charge.
^!charge[state(started)]      // goal meta-events
  <- .suspend(goto(gold)).
^!charge[state(finished)]
  <- .resume(goto(gold)).
Communication Infrastructure

Various communication and execution management infrastructures can be used with JASON:

**Centralised:** all agents in the same machine, one thread by agent, very fast
Communication Infrastructure

Various communication and execution management infrastructures can be used with JASON:

**Centralised**: all agents in the same machine, one thread by agent, very fast

**Centralised (pool)**: all agents in the same machine, fixed number of thread, allows thousands of agents
Communication Infrastructure

Various communication and execution management infrastructures can be used with JASON:

**Centralised:** all agents in the same machine, one thread by agent, very fast

**Centralised (pool):** all agents in the same machine, fixed number of thread, allows thousands of agents

**Jade:** distributed agents, FIPA-ACL
Communication Infrastructure

Various communication and execution management infrastructures can be used with JASON:

**Centralised**: all agents in the same machine, one thread by agent, very fast

**Centralised (pool)**: all agents in the same machine, fixed number of thread, allows thousands of agents

**Jade**: distributed agents, FIPA-ACL

**Saci**: distributed agents, KQML
Communication Infrastructure

Various communication and execution management infrastructures can be used with JASON:

**Centralised:** all agents in the same machine, one thread by agent, very fast

**Centralised (pool):** all agents in the same machine, fixed number of thread, allows thousands of agents

**Jade:** distributed agents, FIPA-ACL

**Saci:** distributed agents, KQML

... others defined by the user (e.g. AgentScape)
Definition of a Simulated Environment

- There will normally be an environment where the agents are situated
Definition of a Simulated Environment

- There will normally be an environment where the agents are situated.
- The agent architecture needs to be customised to get perceptions and act on such environment.
Definition of a Simulated Environment

- There will normally be an environment where the agents are situated
- The agent architecture needs to be customised to get perceptions and act on such environment
- We often want a simulated environment (e.g. to test an MAS application)
Definition of a Simulated Environment

- There will normally be an environment where the agents are situated
- The agent architecture needs to be customised to get perceptions and act on such environment
- We often want a simulated environment (e.g. to test an MAS application)
- This is done in Java by extending JASON’s Environment class
Example of an Environment Class

```java
import jason.*;
import ...;
public class robotEnv extends Environment {
    ...
    public robotEnv() {
        Literal gp =
            Literal.parseLiteral("green_patch(souffle)");
        addPercept(gp);
    }
    public boolean executeAction(String ag, Structure action) {
        if (action.equals(...)) {
            addPercept(ag,
                Literal.parseLiteral("location(souffle,c(3,4))");
        }
        ...
        return true;
    }
}
```
MAS Configuration Language

Simple way of defining a multi-agent system

Example 2.10 (MAS that uses JADE as infrastructure)

MAS my_system {
  infrastructure: Jade
  environment: robotEnv
  agents:
    c3po;
    r2d2 at jason.sourceforge.net;
    bob #10; // 10 instances of bob
  classpath: "..:/lib/graph.jar";
}

R. Bordini, J. Dix · Chapter 13: Multi-Agent Systems, Ed. G. Weiss
MAS Configuration Language II

Configuration of event handling, frequency of perception, user-defined settings, customisations, etc.

Example 2.11 (MAS with customised agent)

MAS custom {
    agents: bob [verbose=2,paramters="sys.properties"]
    agentClass MyAg
    agentArchClass MyAgArch
    beliefBaseClass jason.bb.JDBCPersistentBB(
        "org.hsqldb.jdbcDriver",
        "jdbc:hsqldb:bookstore",
        ...
    )
}

R. Bordini, J. Dix · Chapter 13: Multi-Agent Systems, Ed. G. Weiss

MANUAL DE IDENTIDADE
ELEMENTOS GRÁFICOS
LOGOTIPO

Example 2.12 (CARTAGO environment)

MAS grid_world {

  environment: alice.c4jason.CEnv

  agents:
    cleanerAg
    agentArchClass alice.c4jason.CogAgentArch
    #3;
}

R. Bordini, J. Dix · Chapter 13: Multi-Agent Systems, Ed. G. Weiss
JASON Customisations

- **Agent** class customisation:
  - selectMessage, selectEvent, selectOption, selectIntention, buf, brf, ...
**JASON Customisations**

- **Agent** class customisation:
  
  - selectMessage, selectEvent, selectOption, selectIntention, buf, brf, ...

- **Agent** architecture customisation:
  
  - perceive, act, sendMsg, checkMail, ...

JASON Customisations

- **Agent** class customisation:
  - selectMessage, selectEvent, selectOption, selectIntention, buf, brf, ...

- **Agent** architecture customisation:
  - perceive, act, sendMsg, checkMail, ...

- **Belief base** customisation:
  - add, remove, contains, ...
    - Example available with JASON: persistent belief base (in text files, in data bases, ...)

2 Examples of Programming Languages

2.2 Other BDI-Based Languages

init module{
  knowledge{
    clear(table) . clear(X) :- block(X), not(on(_, X)), not(holding(X)) .

    ...% no initial beliefs about block configuration.
  }

  goals{
    on(a,b), on(b,c), on(c,table), on(d,e), on(e,f), on(f,table).
  }

  actionspec{
    pickup(X) { pre { clear(X), not(holding(_)) } post { true } }
    ...% moving X on top of Y is a constructive move if that move results in X being in position.
  }
}

#define constructiveMove(X,Y) a-goal(tower([X|T])), ...

main module{
  program{
    if a-goal( holding(X) ) then pickup(X) . % put a block you're holding down.
    if bel( holding(X) ) then {
      if constructiveMove(X,Y) then putdown(X,Y) .
      if true then putdown(X, table) .
    }
  }
}

event module{
  program{
    #define inPosition(X) goal-a( tower([X|T]) ) . % block in position if it achieves a goal.

    % rules for processing percepts (assumes full observability).
    forall bel( block(X), not(percept(block(X))) ) do delete( block(X) ) .
    forall bel( percept(block(X)), not(block(X)) ) do insert( block(X) ) .
    ...% rules for processing messages that the agent receives.
  }
}

module adoptgoal{
  ...% rules for processing messages that the agent receives.
}

The init module initializes the agent, here by defining knowledge, an initial goal, and action specifications.

The main module is used to code the agent’s deliberation using rules for selecting actions.

Macro definitions to create more readable code.

Rules in the event module are used to process percepts and messages that the agent receives.

User-defined modules.
A GOAL agent program is a set of modules which consist of various sections including knowledge, beliefs, goals, a program section that contains action rules, and action specifications.
A GOAL agent program is a set of modules which consist of various sections including knowledge, beliefs, goals, a program section that contains action rules, and action specifications.

Each of these sections is represented in a knowledge representation language such as Prolog, answer set programming, SQL (or Datalog), or the planning domain definition language.
GOAL cont.

- A GOAL agent program is a set of modules which consist of various sections including knowledge, beliefs, goals, a program section that contains action rules, and action specifications.

- Each of these sections is represented in a knowledge representation language such as Prolog, answer set programming, SQL (or Datalog), or the planning domain definition language.

GOAL cont.

- A GOAL agent program is a set of modules which consist of various sections including knowledge, beliefs, goals, a program section that contains action rules, and action specifications.

- Each of these sections is represented in a knowledge representation language such as Prolog, answer set programming, SQL (or Datalog), or the planning domain definition language.

- [Hindriks and Roberti, 2009, Hindriks, 2007].

2.3 Approaches based on executable logics
Concurrent **METATEM**

- **METATEM** is a programming language for multiagent systems based on a *first-order temporal logic* (with discrete, linear models with finite past and infinite future) [Fisher, 1997].
Concurrent METATEM

- METATEM is a programming language for multiagent systems based on a **first-order temporal logic** (with discrete, linear models with finite past and infinite future) [Fisher, 1997].

- Concurrent METATEM is the **concurrent extension** of METATEM [Fisher, 1996].
Concurrent $\text{METATEM}$

- $\text{METATEM}$ is a programming language for multiagent systems based on a *first-order temporal logic* (with discrete, linear models with finite past and infinite future) [Fisher, 1997].

- Concurrent $\text{METATEM}$ is the *concurrent extension* of $\text{METATEM}$ [Fisher, 1996].

- A Concurrent $\text{METATEM}$ system contains a number of concurrently executing agents which are able to communicate through message passing.
Concurrent METATEM

- METATEM is a programming language for multiagent systems based on a first-order temporal logic (with discrete, linear models with finite past and infinite future) [Fisher, 1997].

- Concurrent METATEM is the concurrent extension of METATEM [Fisher, 1996].

- A Concurrent METATEM system contains a number of concurrently executing agents which are able to communicate through message passing.

- Each agent executes a first-order temporal logic specification of its desired behaviour.
Concurrent MÉTATEM cont.

- An agent has two main components: (1) an **interface** which defines how the agent may interact with its environment (i.e. other agents), (2) a **computational engine**, defining how the agent may act.
Concurrent METATEM cont.

- An agent has two main components: (1) an interface which defines how the agent may interact with its environment (i.e. other agents), (2) a computational engine, defining how the agent may act.
- The computational engine of an agent is based on the METATEM paradigm of executable temporal logics.
Concurrent METATEM cont.

- An agent has two main components: (1) an **interface** which defines how the agent may interact with its environment (i.e. other agents), (2) a **computational engine**, defining how the agent may act.
- The computational engine of an agent is based on the METATEM paradigm of **executable temporal logics**.
- The idea behind this approach is to directly execute a declarative agent specification given as a set of **program rules** which are temporal logic formulae of the form: “**antecedent about past → consequent about future**”. The intuitive interpretation of such a rule is “**on the basis of the past, do so in the future**”.

R. Bordini, J. Dix · Chapter 13: Multi-Agent Systems, Ed. G. Weiss
Con-Golog, Indi-Golog

ConGolog ([Giacomo et al., 2000]) and IndiGolog ([Giacomo et al., 2009]) are languages extending Golog, a language based on the situation calculus introduced by McCarthy. Golog stands for alGOl in LOGic.
Con-Golog, Indi-Golog

- ConGolog ([Giacomo et al., 2000]) and IndiGolog ([Giacomo et al., 2009]) are languages extending Golog, a language based on the situation calculus introduced by McCarthy. Golog stands for alGOl in LOGic.

- Actions are described as in the classical STRIPS approach: they have preconditions that must be satisfied in order to apply the action. The postcondition then describes the change of the world.
Con-Golog, Indi-Golog

- ConGolog ([Giacomo et al., 2000]) and IndiGolog ([Giacomo et al., 2009]) are languages extending Golog, a language based on the situation calculus introduced by McCarthy. Golog stands for alGO in LOGic.

- Actions are described as in the classical STRIPS approach: they have preconditions that must be satisfied in order to apply the action. The postcondition then describes the change of the world.

- The evolution of the world is described within the logical language by fluents, which are terms in the language. The effects of an action is formalised by successor-state axioms: they describe what the successor state of a given state looks like if an action is applied.
Con-Golog, Indi-Golog cont.

- Golog is a programming language that hides the application of the situation calculus and is thus much more user-friendly.
Con-Golog, Indi-Golog cont.

- Golog is a programming language that hides the application of the situation calculus and is thus much more user-friendly.
- Procedures in Golog actions are reduced to primitive actions which refer to actions in the real world, such as picking up objects, opening doors, moving from one room to another, and so on.
3. Organisation and Environment Programming

- MOISE
- CARTAGO
Organisations and Environments

- There are many approaches to agent organisations and agent environments
Organisations and Environments

- There are many approaches to agent organisations and agent environments
- Not many are practical enough to use in multi-agent systems development
Organisations and Environments

- There are many approaches to agent organisations and agent environments
- Not many are practical enough to use in multi-agent systems development
- In these slides we will look particularly at MOISE for programming organisations and CARTAGO for programming environments
3.1 MOISE
MOISE Framework

- MOISE Organisation Modelling Language as Tag-based language (issued from MOISE [Hannoun et al., 2000], MOISE⁺ [Hübner et al., 2002a], MOISEINST [Gâteau et al., 2005])
MOISE Framework

- MOISE Organisation Modelling Language as Tag-based language (issued from MOISE [Hannoun et al., 2000], MOISE+ [Hübner et al., 2002a], MOISEINST [Gâteau et al., 2005])
- OMI developed as an artefact-based working environment (ORA4MAS [Hübner et al., 2009] based on CARTAGO nodes) (refactoring of S-MOISE+ [Hübner et al., 2006] and SYNAI [Gâteau et al., 2005])
  - dedicated organisational artefacts that provide general services for the agents to work within an organisation
  - organisational agents that monitor and manage the functioning of the organisation
**MOISE Framework**

- **MOISE** Organisation Modelling Language as Tag-based language (issued from **MOISE** [Hannoun et al., 2000], **MOISE**+ [Hübner et al., 2002a], **MOISE**INST [Gâteau et al., 2005])

- OMI developed as an artefact-based working environment (ORA4MAS [Hübner et al., 2009] based on CARTAGO nodes) (refactoring of **S-MOISE**+ [Hübner et al., 2006] and **SYNAI** [Gâteau et al., 2005])
  - dedicated *organisational artefacts* that provide general services for the agents to work within an organisation
  - *organisational agents* that monitor and manage the functioning of the organisation

- Dedicated integration bridges for
  - Agents and Environment (c4Jason, c4Jadex [Ricci et al., 2009a])
  - Environment and Organisation ( [Piunti et al., 2009a])
Modelling Dimensions

**Structural Specification**
- Groups, links, roles
- *Compatibilities, multiplicities, inheritance*

**Functional Specification**
- Global goals, plans, Missions, schemas, preferences
- Allows agents autonomy!

**Normative Specification**

**Moise OML Structural Specification**

- Specifies the structure of an MAS along three levels:
  - *Individual with Role*
  - *Social with Link*
  - *Collective with Group*
MOISE OML Structural Specification

- Specifies the structure of an MAS along three levels:
  - *Individual* with *Role*
  - *Social* with *Link*
  - *Collective* with *Group*

- Components:
  - *Role*: label used to assign constraints on the behavior of agents playing it
  - *Link*: relation between roles that directly constrains the agents in their interaction with the other agents playing the corresponding roles
  - *Group*: set of links, roles, compatibility relations used to define a shared context for agents playing roles in it
Defined with the tag `structural-specification` in the context of an `organisational-specification`
MOISE OML Structural Specification II

Example 3.1
MOISE OML Structural Specification III

```xml
<organisational-specification>
  <structural-specification>
    <role-definitions> ... </role-definitions>
    <group-specification id="xxx">
      ...
    </group-specification>
  </structural-specification>
  ...
</organisational-specification>
```
Role Specification I

- Role definition (role tag) in role-definitions section, is composed of:
  - identifier of the role (id attribute of role tag)
  - inherited roles (extends tag) - by default, all roles inherit of the soc role -
Role Specification II

Example 3.2
Role Specification III

```
<role-definitions>
  <role id="player" />
  <role id="coach" />
  <role id="middle"> <extends role="player"/> </role>
  <role id="leader"> <extends role="player"/> </role>
  <role id="r1">
    <extends role="r2" />
    <extends role="r3" />
  </role>
...  
</role-definitions>
```
Group Specification I

- Group definition (group-specification tag) is composed of:
  - group identifier (id attribute of group-specification tag)
Group Specification II

Example 3.3

```xml
<group-specification id="team">
  <roles>
    <role id="coach" min="1" max="2"/>
  </roles>
  <links> ...
  </links>
  <sub-groups> ...
  </sub-groups>
  <formation-constraints> ...
</group-specification>
```
Link Specification I

- Link definition (link tag) included in the group definition is composed of:
  - role identifiers (from, to)
  - type (type) with one of the following values: authority, communication, acquaintance
  - scope of the link (scope): inter-group, intra-group
  - validity in sub-groups: if extends-sub-group set to true, the link is also valid in all sub-groups (default false)
Link Specification II

Example 3.4

```xml
<link from="coach"
    to="player"
    type="authority"
    scope="inter-group"
    extends-sub-groups="true" />
```
Formation Constraint Specification I

- Formation constraints definition (formation-constraints tag) in a group definition is composed of:
  - compatibility constraints (compatibility tag) between roles (from, to), with a scope, extends-sub-groups and directions (bi-dir)
Formation Constraint Specification II

Example 3.5
<formation-constraints>
  <compatibility from="middle"
      to="leader"
      scope="intra-group"
      extends-sub-groups="false"
      bi-dir="true"/>

  ...
</formation-constraints>

Moise OML Functional Specification I

- Specifies the expected behaviour of an MAS in terms of goals along two levels:
  - Collective with Scheme
  - Individual with Mission
**MOISE OML Functional Specification II**

- *Maintenance goal.* Goals of this type are not satisfied at a precise moment but are pursued while the scheme is running. The agents committed to them do not need to declare that they are satisfied.

- *Scheme:* global goal decomposition tree assigned to a group
  - Any scheme has a root goal that is decomposed into subgoals.
Goal States

waiting \rightarrow \text{ready}

waiting \text{ initial state}

impossible \rightarrow \text{satisfied}
Goal States

waiting

ready

impossible

satisfied

waiting  initial state
ready   goal pre-conditions are satisfied &
scheme is well-formed

R. Bordini, J. Dix · Chapter 13: Multi-Agent Systems, Ed. G. Weiss
### Goal States

**waiting**  
Initial state

**ready**  
Goal pre-conditions are satisfied & scheme is well-formed

**satisfied**  
Agents committed to the goal have achieved it
Goal States

waiting  initial state
ready  goal pre-conditions are satisfied & scheme is well-formed
satisfied  agents committed to the goal have achieved it
impossible  the goal is impossible to be satisfied
MOISE OML Functional Specification I

- Defined with the tag `functional-specification` in the context of an `organisational-specification`
Example 3.6
<functional-specification>
  <scheme id="sideAttack" >
    <goal id="dogoal" > ... </goal>
    <mission id="m1" min="1" max="5">
      ...
      </mission>
      ...
  </scheme>
  ...
</functional-specification>
Scheme Specification I

- Scheme definition *(scheme tag)* is composed of:
  - identifier of the scheme *(id attribute of scheme tag)*
  - the root goal of the scheme with the plan aiming at achieving it *(goal tag)*
  - the set of missions structuring the scheme *(mission tag)*
Scheme Specification II

- min. number of agents that must satisfy it (min) (default is “all”)
- optionally, an argument (argument tag) that must be assigned to a value when the scheme is created
- optionally a plan

Plan definition attached to a goal (plan tag) is composed of

- one and only one operator (operator attribute of plan tag) with sequence, choice, parallel as possible values
- set of goal definitions (goal tag) concerned by the operator
Scheme Specification Example

```xml
<scheme id="sideAttack">
  <goal id="scoreGoal" min="1">
    <plan operator="sequence">
      <goal id="g1" min="1" ds="get the ball" />
      <goal id="g2" min="3" ds="to be well placed">
        <plan operator="parallel">
          <goal id="g7" min="1" ds="go toward the opponent’s field" />
          <goal id="g8" min="1" ds="be placed in the middle field" />
          <goal id="g9" min="1" ds="be placed in the opponent’s goal area" />
        </plan>
      </goal>
    </plan>
  </goal>
  <goal id="g3" min="1" ds="kick the ball to the m2Ag">
    <argument id="M2Ag" />
  </goal>
  <goal id="g4" min="1" ds="go to the opponent’s back line" />
  <goal id="g5" min="1" ds="kick the ball to the goal area" />
  <goal id="g6" min="1" ds="shot at the opponent’s goal" />
</scheme>
```
Mission Specification I

Mission definition (mission tag) in the context of a scheme definition, is composed of:
Mission Specification II

Example 3.7

```xml
<scheme id="sideAttack">
  ... the goals ...
  <mission id="m1" min="1" max="1">
    <goal id="scoreGoal" />
    <goal id="g1" />
    <goal id="g3" />
  </mission>
  ...
</scheme>
```
Functional Specification Example (1)

Graphical representation of social scheme for joj team
Functional Specification Example (2)

Graphical representation of social scheme “side_attack” for joj team

Key

Organizational Entity

Lucio ------ \( m1 \)
Cafu ------ \( m2 \)
Rivaldo ------ \( m3 \)

Scheme

\begin{itemize}
\item missions
\item goal
\item success rate
\item sequence
\item choice
\item parallelism
\end{itemize}
Explicit relation between the functional and structural specifications
Explicit relation between the functional and structural specifications

Permissions and obligations to commit to missions in the context of a role
MOISE OML Normative Specification

- Explicit relation between the functional and structural specifications
- Permissions and obligations to commit to missions in the context of a role
- Makes explicit the normative dimension of a role
MOISE OML Normative Specification

- Defined with the tag `normative-specification` in the context of an `organisational-specification`

Example 3.8

```xml
<normative-specification>
  <norm id="n1" ... />
  ...
  <norm id="..." ... />
</normative-specification>
```
MOISE OML Normative Specification

- Defined with the tag `normative-specification` in the context of an `organisational-specification`
- Specification in sequence of the different norms participating to the governance of the organisation

Example 3.8

```xml
<normative-specification>
  <norm id="n1" ... />
  ...
  <norm id="..." ... />
</normative-specification>
```
Norm Specification

- Norm definition (norm tag) in the context of a normative-specification definition, is composed of:
Norm Specification

- Norm definition (norm tag) in the context of a normative-specification definition, is composed of:
  - the identifier of the norm (id)
Norm Specification

- Norm definition (norm tag) in the context of a normative-specification definition, is composed of:
  - the identifier of the norm (id)
  - the type of the norm (type) with obligation, permission as possible values
Norm Specification

- Norm definition (norm tag) in the context of a normative-specification definition, is composed of:
  - the identifier of the norm (id)
  - the type of the norm (type) with obligation, permission as possible values
  - optionally a condition of activation (condition) with the following possible expressions:
    - checking of properties of the organisation (e.g. #role_compatibility, #mission_cardinality, #role_cardinality, #goal_non_compliance)
    - unregimentation of organisation properties!!!
    - (un)fulfillment of an obligation stated in a particular norm (unfulfilled, fulfilled)
Norm Specification

- Norm definition (norm tag) in the context of a normative-specification definition, is composed of:
  - the identifier of the norm (id)
  - the type of the norm (type) with obligation, permission as possible values
  - optionally a condition of activation (condition) with the following possible expressions:
    - checking of properties of the organisation (e.g. #role_compatibility, #mission_cardinality, #role_cardinality, #goal_non_compliance)
    - unregimentation of organisation properties!!!
    - (un)fulfillment of an obligation stated in a particular norm (unfulfilled, fulfilled)
  - the identifier of the role (role) on which the role is applied
Norm Specification

- Norm definition (norm tag) in the context of a normative-specification definition, is composed of:
  - the identifier of the norm (id)
  - the type of the norm (type) with obligation, permission as possible values
  - optionally a condition of activation (condition) with the following possible expressions:
    - checking of properties of the organisation (e.g. #role_compatibility, #mission_cardinality, #role_cardinality, #goal_non_compliance)
    - (un)fulfillment of an obligation stated in a particular norm (unfulfilled, fulfilled)
  - the identifier of the role (role) on which the role is applied
  - the identifier of the mission (mission) concerned by the norm

R. Bordini, J. Dix · Chapter 13: Multi-Agent Systems, Ed. G. Weiss
**Norm Specification**

- Norm definition (norm tag) in the context of a normative-specification definition, is composed of:
  - the identifier of the norm (id)
  - the type of the norm (type) with obligation, permission as possible values
  - optionally a condition of activation (condition) with the following possible expressions:
    - checking of properties of the organisation (e.g. #role_compatibility, #mission_cardinality, #role_cardinality, #goal_non_compliance)
    - unregimentation of organisation properties!!!
    - (un)fulfillment of an obligation stated in a particular norm (unfulfilled, fulfilled)
  - the identifier of the role (role) on which the role is applied
  - the identifier of the mission (mission) concerned by the norm
  - optionally a time constraint (time-constraint)
Norm Specification – example

<table>
<thead>
<tr>
<th>role</th>
<th>deontic</th>
<th>mission</th>
<th>TTF</th>
</tr>
</thead>
<tbody>
<tr>
<td>back</td>
<td>obliged</td>
<td>m1</td>
<td>get the ball, go ... 1 minute</td>
</tr>
<tr>
<td>left</td>
<td>obliged</td>
<td>m2</td>
<td>be placed at ..., kick ... 3 minute</td>
</tr>
<tr>
<td>right</td>
<td>obliged</td>
<td>m2</td>
<td>1 day</td>
</tr>
<tr>
<td>attacker</td>
<td>obliged</td>
<td>m3</td>
<td>kick to the goal, ... 30 seconds</td>
</tr>
</tbody>
</table>

<norm id = "n1" type="obligation"
role="back" mission="m1" time-constraint="1 minute"/>
...

<norm id = "n4" type="obligation"
condition="unfulfilled(obligation(_,n2,_,_))"
role="coach" mission="ms" time-constraint="3 hour"/>
...
Organisation Entity Dynamics

1. Organisation is created (by the agents)
   - instances of groups
   - instances of schemes
3 Organisation and Environment Programming

3.1 MOISE

Organisation Entity Dynamics

1. Organisation is created (by the agents)
   - instances of groups
   - instances of schemes

2. Agents enter into groups adopting roles
3 Organisation and Environment Programming

3.1 MOISE

Organisation Entity Dynamics

1. Organisation is created (by the agents)
   - instances of groups
   - instances of schemes

2. Agents enter into groups \textit{adopting} roles

3. Groups become \textit{responsible} for schemes
   - Agents from the group are then obliged to commit to missions in the scheme
Organisation Entity Dynamics

1. Organisation is created (by the agents)
   - instances of groups
   - instances of schemes

2. Agents enter into groups *adopting* roles

3. Groups become *responsible* for schemes
   - Agents from the group are then obliged to commit to missions in the scheme

4. Agents *commit* to missions
Organisation Entity Dynamics

1. Organisation is created (by the agents)
   - instances of groups
   - instances of schemes

2. Agents enter into groups adopting roles

3. Groups become responsible for schemes
   - Agents from the group are then obliged to commit to missions in the scheme

4. Agents commit to missions

5. Agents fulfil mission’s goals
Organisation Entity Dynamics

1. Organisation is created (by the agents)
   - instances of groups
   - instances of schemes

2. Agents enter into groups adopting roles

3. Groups become responsible for schemes
   - Agents from the group are then obliged to commit to missions in the scheme

4. Agents commit to missions

5. Agents fulfil mission’s goals

6. Agents leave schemes and groups
Organisation Entity Dynamics

1. Organisation is created (by the agents)
   - instances of groups
   - instances of schemes

2. Agents enter into groups adopting roles

3. Groups become responsible for schemes
   - Agents from the group are then obliged to commit to missions in the scheme

4. Agents commit to missions

5. Agents fulfil mission’s goals

6. Agents leave schemes and groups

7. Schemes and groups instances are destroyed
Organisation management infrastructure (OMI) I

Responsibility

- Managing – coordination, regulation – the agents’ execution within organisation defined in an organisational specification
Organisation management infrastructure (OMI) II

(e.g. MadKit, AMELI, $S\text{-MOISE}^+$, ...)

R. Bordini, J. Dix · Chapter 13: Multi-Agent Systems, Ed. G. Weiss
Organisational artifacts in ORA4MAS

- based on A&A and MOISE
- agents create and handle organisational artifacts
- artifacts in charge of regimentations, detection and evaluation of norms compliance
- agents are in charge of decisions about sanctions
- distributed solution
ORA4MAS – GroupBoard artifact

Operations:
- adoptRole(role): the agent executing this operation tries to adopt a role in the group
ORA4MAS – GroupBoard artifact

**Operations:**

- **adoptRole(role):** the agent executing this operation tries to adopt a role in the group
- **leaveRole(role):**
ORA4MAS – GroupBoard artifact

**Operations:**

- **adoptRole(role):** the agent executing this operation tries to adopt a role in the group
- **leaveRole(role):**
- **addScheme(schid):** the group starts to be responsible for the scheme managed by the SchemeBoard `schId`
ORA4MAS – GroupBoard artifact

Operations:

- **adoptRole(role):** the agent executing this operation tries to adopt a role in the group
- **leaveRole(role):**
- **addScheme(schid):** the group starts to be responsible for the scheme managed by the SchemeBoard `schId`
- **removeScheme(schid):**
ORA4MAS – GroupBoard artifact

Observable Properties:

- **specification**: the specification of the group in the OS (an object of class moise.os.ss.Group)
ORA4MAS – GroupBoard artifact

Observable Properties:

- **specification**: the specification of the group in the OS (an object of class moise.os.ss.Group)
- **players**: a list of agents playing roles in the group. Each element of the list is a pair (agent x role)

GroupBoard

- Specification

- **players**: a list of agents committed to the scheme. Each element of the list is a pair (agent, mission)
- **goals**: a list with the current state of the goals
- **obligations**: list of obligations currently active in the scheme
Organisational Artifact Implementation I

- Organisational artifacts are programmed with a Normative Programming Language (NPL) [Hübner et al., 2010]
- The NPL norms have
  - an activation condition
  - a consequence
Organisational Artifact
Implementation II
Organisational Artifact
Implementation III

\[
\text{norm n1: plays}(A,\text{writer},G) \rightarrow \text{fail}.
\]

or

\[
\text{norm n1: plays}(A,\text{writer},G) \rightarrow \text{obligation}(A,\text{n1},\text{plays}(A,\text{editor},G), '\text{now + 3 min}').
\]
Agent integration

Agents can interact with organisational artifacts as with ordinary artifacts by perception and action.

Agent integration provides some “internal” tools for the agents to simplify their interaction with the organisation:
Agent integration

- Agents can interact with organisational artifacts as with ordinary artifacts by perception and action.

Any Agent Programming Language integrated with CARTAGO can use organisational artifacts.

Agent integration provides some “internal” tools for the agents to simplify their interaction with the organisation:
Agent integration

Any Agent Programming Language integrated with CARTAGO can use organisational artifacts.

Agent integration provides some “internal” tools for the agents to simplify their interaction with the organisation:

- maintenance of a local copy of the organisational state.
Agent integration

- Agents can interact with organisational artifacts as with ordinary artifacts by perception and action

Any Agent Programming Language integrated with CARTAGO can use organisational artifacts

Agent integration provides some “internal” tools for the agents to simplify their interaction with the organisation:

- maintenance of a local copy of the organisational state
- production of organisational events
Agent integration

- Agents can interact with organisational artifacts as with ordinary artifacts by perception and action.

Any Agent Programming Language integrated with CARTEGO can use organisational artifacts.

Agent integration provides some “internal” tools for the agents to simplify their interaction with the organisation:

- maintenance of a local copy of the organisational state
- production of organisational events
- provision of organisational actions
3.2 CARTAGO
Agents and Artifacts (A&A) Conceptual Model:
Background Human Metaphor
A&A Basic Concepts [Omicini et al., 2008]

- Agents
  - autonomous, goal-oriented pro-active entities
  - create and co-use artifacts for supporting their activities
    - besides direct communication
A&A Basic Concepts [Omicini et al., 2008]

- Agents
  - autonomous, goal-oriented pro-active entities
  - create and co-use artifacts for supporting their activities
    - besides direct communication
- Artifacts
  - non-autonomous, function-oriented, stateful entities
    - controllable and observable
  - modelling the tools and resources used by agents
    - designed by MAS programmers
Agents
- autonomous, goal-oriented pro-active entities
- create and co-use artifacts for supporting their activities
  - besides direct communication

Artifacts
- non-autonomous, function-oriented, stateful entities
  - controllable and observable
  - modelling the tools and resources used by agents
  - designed by MAS programmers

Workspaces
- grouping agents & artifacts
- defining the topology of the computational environment
A&A Programming Model

Features [Ricci et al., 2007a]

- Abstraction
  - artifacts as first-class resources and tools for agents
**A&A Programming Model**

*Features [Ricci et al., 2007a]*

- **Abstraction**
  - artifacts as first-class resources and tools for agents
- **Modularisation**
  - artifacts as modules encapsulating functionalities, organized in workspaces
A&A Programming Model

Features [Ricci et al., 2007a]

- Abstraction
  - artifacts as first-class resources and tools for agents
- Modularisation
  - artifacts as modules encapsulating functionalities, organized in workspaces
- Extensibility and openness
  - artifacts can be created and destroyed at runtime by agents
A&A Programming Model

Features [Ricci et al., 2007a]

- **Abstraction**
  - artifacts as first-class resources and tools for agents

- **Modularisation**
  - artifacts as modules encapsulating functionalities, organized in workspaces

- **Extensibility and openness**
  - artifacts can be created and destroyed at runtime by agents

- **Reusability**
  - artifacts (types) as reusable entities, for setting up different kinds of environments
Artificial Abstract Representation

A World of Artifacts

- A counter
- A flag
- A Stock Quote Web Service
- A database
- A bounded buffer
- An agenda
- An event service
- A tuple space

R. Bordini, J. Dix · Chapter 13: Multi-Agent Systems, Ed. G. Weiss
A Simple Taxonomy

- Individual or personal artifacts
  - designed to provide functionalities for a single agent use
A Simple Taxonomy

- Individual or personal artifacts
  - designed to provide functionalities for a single agent use
    - e.g. an agenda for managing deadlines, a library...
A Simple Taxonomy

- Individual or personal artifacts
  - designed to provide functionalities for a single agent use
    - e.g. an agenda for managing deadlines, a library...

- Social artifacts
  - designed to provide functionalities for structuring and managing the interaction in a MAS
  - coordination artifacts [Omicini et al., 2004], organisation artifacts, ...
A Simple Taxonomy

- Individual or personal artifacts
  - designed to provide functionalities for a single agent use
    - e.g. an agenda for managing deadlines, a library...

- Social artifacts
  - designed to provide functionalities for structuring and managing the interaction in a MAS
  - coordination artifacts [Omicini et al., 2004], organisation artifacts, ...
    - e.g. a blackboard, a game-board,...
A Simple Taxonomy

- Individual or personal artifacts
  - designed to provide functionalities for a single agent use
    - e.g. an agenda for managing deadlines, a library...

- Social artifacts
  - designed to provide functionalities for structuring and managing the interaction in a MAS
  - coordination artifacts [Omicini et al., 2004], organisation artifacts, ...
    - e.g. a blackboard, a game-board,...

- Boundary artifacts
  - to represent external resources/services
    - e.g. a printer, a Web Service
  - to represent devices enabling I/O with users
    - e.g. GUI, console, etc.
Actions and Percepts in Artifact-Based Environments I

- Explicit semantics defined by the (endogenous) environment [Ricci et al., 2010]
  - success/failure semantics, execution semantics
  - defining the *contract* provided by the environment
Actions and Percepts in Artifact-Based Environments II

actions ↔ artifacts’ operation

the action repertoire is given by the dynamic set of operations provided by the overall set of artifacts available in the workspace can be changed by creating/disposing artifacts

- action success/failure semantics is defined by operation semantics
Actions and Percepts in Artifact-Based Environments III

percepts ←→ artifacts’ observable properties + signals

properties represent percepts about the state of the environment
signals represent percepts concerning events signalled by the environment
Interaction Model: Use

- Performing an action corresponds to triggering the execution of an operation
  - acting on artifact’s usage interface
Interaction Model: Operation execution

- a process structured in one or multiple transactional steps
Interaction Model: Operation execution

- a process structured in one or multiple transactional steps
- asynchronous with respect to agent
  - ...which can proceed possibly reacting to percepts and executing actions of other plans/activities
Interaction Model: Operation execution

- a process structured in one or multiple transactional steps
- asynchronous with respect to agent
  - ...which can proceed possibly reacting to percepts and executing actions of other plans/activities
- operation completion causes action completion
  - action completion events with success or failure
Interaction Model: Observation

- Agents can dynamically select which artifacts to observe
  - predefined focus/stopFocus actions
Interaction Model: Observation

- By focussing an artifact
  - observable properties are mapped into agent dynamic knowledge about the state of the world, as percepts
    - e.g. belief base
  - signals are mapped as percepts related to observable events
Artifact Linkability

- Basic mechanism to enable inter-artifact interaction
  - *linking* artifacts through interfaces (link interfaces)
    - operations triggered by an artifact over an other artifact
Artifact Linkability

- Basic mechanism to enable inter-artifact interaction
  - *linking* artifacts through interfaces (link interfaces)
  - operations triggered by an artifact over another artifact
- Useful to design & program distributed environments
  - realised by a set of artifacts linked together
  - possibly hosted in different workspaces
Artifact Manual

- Agent-readable description of artifact’s...
  - ...functionality
    - what functions/services artifacts of that type provide
Artifact Manual

- Agent-readable description of artifact’s...
  - ...functionality
    - what functions/services artifacts of that type provide
  - ...operating instructions
    - how to use artifacts of that type
Artifact Manual

- Agent-readable description of artifact’s…
  - …*functionality*
    - *what* functions/services artifacts of that type provide
  - …*operating instructions*
    - *how* to use artifacts of that type
- Towards advanced use of artifacts by intelligent agents [Piunti et al., 2008]
  - dynamically choosing which artifacts to use to accomplish their tasks and how to use them
  - strong link with Semantic Web research issues

R. Bordini, J. Dix · Chapter 13: Multi-Agent Systems, Ed. G. Weiss

MIT Press, May 2012
Artifact Manual

  - dynamically choosing which artifacts to use to accomplish their tasks and how to use them
  - strong link with Semantic Web research issues
- Work in progress
  - defining ontologies and languages for describing the manuals
CARtAGo

- Common ARtifact infrastructure for AGent Open environment (CARtAGo) [Ricci et al., 2009b]
**CARTAGO**

- Common ARtifact infrastructure for AGent Open environment (CARTAGO) [Ricci et al., 2009b]
- Computational framework / infrastructure to implement and run artifact-based environment [Ricci et al., 2007b]
  - Java-based programming model for defining artifacts
  - set of basic API for agent platforms to work within artifact-based environment
CARTAGO

- Common ARtifact infrastructure for AGent Open environment (CARTAGO) [Ricci et al., 2009b]
- Computational framework / infrastructure to implement and run artifact-based environment [Ricci et al., 2007b]
  - Java-based programming model for defining artifacts
  - set of basic API for agent platforms to work within artifact-based environment
- Distributed and open MAS
  - workspaces distributed on Internet nodes
    - agents can join and work in multiple workspace at a time
  - Role-Based Access Control (RBAC) security model
CARTAGO

- Common ARtifact infrastructure for AGent Open environment (CARTAGO) [Ricci et al., 2009b]
- Computational framework / infrastructure to implement and run artifact-based environment [Ricci et al., 2007b]
  - Java-based programming model for defining artifacts
  - set of basic API for agent platforms to work within artifact-based environment
- Distributed and open MAS
  - workspaces distributed on Internet nodes
    - agents can join and work in multiple workspace at a time
  - Role-Based Access Control (RBAC) security model
- Open-source technology
Integration with Agent Languages and Platforms

Integration with existing agent platforms [Ricci et al., 2008]
- available bridges: JASON, Jadex, AgentFactory, simpA, ...
- ongoing: 2APL
- including organisation platforms: MOISE framework [Hübner et al., 2002b, Hübner et al., 2006]
Integration with Agent Languages and Platforms

- Integration with existing agent platforms [Ricci et al., 2008]
  - available bridges: JASON, Jadex, AgentFactory, simpA, ...
  - ongoing: 2APL
- including organisation platforms: MOISE framework [Hübner et al., 2002b, Hübner et al., 2006]

- Outcome
  - developing open and heterogenous MAS
  - introducing a further perspective on interoperability besides the ACL’s one
    - sharing and working in a common work environment
    - common object-oriented data-model
Other Features

- Other CARTAGO features not discussed in this lecture
  - linkability
    - executing chains of operations across multiple artifacts
  - multiple workspaces
    - agents can join and work in multiple workspaces, concurrently
    - including remote workspaces
  - RBAC security model
    - workspace artifact provides operations to set/change the access control policies of the workspace, depending on the agent role
    - ruling agents’ access and use of artifacts of the workspace

...
Other Features

- Other CArTAgo features not discussed in this lecture

4. An Example in JACAMO

- Organisation Program
- Agent Programs
- Environment Program
Introduction

- Running example used in Chapters 13 to 15
Introduction

- Running example used in Chapters 13 to 15
- Scenario introduced in more details in Chapter 15
Introduction

- Running example used in Chapters 13 to 15
- Scenario introduced in more details in Chapter 15
- The design was made with the focus of demonstrating the JACAMO approach rather than the best solution for the problem
Introduction

- Running example used in Chapters 13 to 15
- Scenario introduced in more details in Chapter 15
- The design was made with the focus of demonstrating the JACAMO approach rather than the best solution for the problem
- We show here code excerpts from the 3 JACAMO levels: agent, organisation, and environment
Introduction

- Running example used in Chapters 13 to 15
- Scenario introduced in more details in Chapter 15
- The design was made with the focus of demonstrating the JACAMO approach rather than the best solution for the problem
- We show here code excerpts from the 3 JACAMO levels: agent, organisation, and environment
- The full running example can be downloaded from http://www.inf.pucrs.br/r.bordini/WeissBookChapter13Ex
Scenario

- The chosen running example centers mostly on the organisation level and, in this design, partly on the environment.
Scenario

- The chosen running example centers mostly on the organisation level and, in this design, partly on the environment.
- Agents are very simple and in general they only execute the required action at the required time in orchestration with the team, which is mostly handled by the organisation.
Scenario

- The chosen running example centers mostly on the organisation level and, in this design, partly on the environment.
- Agents are very simple and in general they only execute the required action at the required time in orchestration with the team, which is mostly handled by the organisation.
- Left as exercise to extend to multiple units; there are both JASON and CARTAGO solutions for contract net.
Scenario

- The chosen running example centers mostly on the organisation level and, in this design, partly on the environment
- Agents are very simple and in general they only execute the required action at the required time in orchestration with the team, which is mostly handled by the organisation
- Left as exercise to extend to multiple units; there are both JASON and CARtAGO solutions for contract net
- The assembly cell of a manufacturing plant is assumed to have two jigs in a rotating table, with two manufacturing robots located at two ends of the table: one that mostly does loading and unloading tasks and another that is able to join separate parts that have been loaded into a jig
Summary of the Manufacturing Process (quoted from Chapter 15) I

1. robot1 loads an A part into one of the jigs on the rotating table
Summary of the Manufacturing Process (quoted from Chapter 15) II

7. the flipper flips the part over ("BA") at the same time as robot1 loads a C part into the jig
8. the BA part is loaded on top of the C part
9. the table rotates
10. robot2 joins the C and BA parts, yielding a complete ABC part
11. the table is rotated, and
12. robot1 then unloads the finished part.
Summary of the Manufacturing Process (quoted from Chapter 15) III

Although this process may sound straightforward, it is made more complex by the need to manage a number of concurrent assembly jobs. In other words, we want to be able to exploit parallelism, for instance having robot2 be assembling one part while robot1 is unloading a different order. On the other hand, we need to respect synchronization requirements such as not moving the table while robot1 or robot2 are operating.
Summary of the Manufacturing Process (quoted from Chapter 15) IV

- Note that in general in *holonic manufacturing* there are multiple interchangeable entities so that the process of selecting a table, or an assembly robot, needs some mechanism to manage load-balancing (e.g. using contract net).
Overview of a Manufacturing Cell (from Chapter 15)
4.1 Organisation Program
Organisation I

- Very simple to specify this coordination problem in Moise
Organisation II

- Agents playing each of the 4 roles needed for a functional “assembly cell group”
- This example only uses some of the MOISE expression power
- Agent “cellmngmr” used only to simulate the allocation of assembling tasks, for testing; it uses an artefact where manufacturing requests appear
- An instance of the manufacture_ABC scheme (see functional specification) is created for each accepted task: as there are two jigs a cell can concurrently manufacture two pieces
MOISE Organisation: Structural Specification

```
simple controller
  loader
  joiner
  rotator
flipper

assembly_cell_group

role
group
```

R. Bordini, J. Dix - Chapter 13: Multi-Agent Systems, Ed. G. Weiss
The Social Plan I

- The Functional Specification defines the whole social plan
The Social Plan II

- Much interagent communication was saved by delegating the coordination task to the organisation.
- At run-time, the organisation will assign goals to agents at the appropriate times, taking into consideration the partial ordering of the goals to be achieved according to the functional specification.
- Functional structure diagram also annotates each goal to be achieved with one of four different missions (loading, joining, flipping, and rotating).
The Social Plan III

- The normative refers to these mission to determine which sets of goals the agents playing each of the four roles will be asked to achieve (by the organisation management infrastructure, at runtime)
**MOISE Organisation: Functional Specification**

Manufacture ABC

Assemble AB

- Rotating
- Wait for empty jig [6 min]
- Loading
  - a loaded [4 min]
  - Table rotated [2 min]
  - Loading
    - b loaded [4 min]
- Loading
  - ab joined [5 min]
- Joining
  - ab moved to flipper [3 min]
- Loading
  - Flipping
    - flipped to ba [3 min]
- Loading
  - C loaded [4 min]
- Loading
  - Load while flip
  - ba loaded on top of c [5 min]
- Loading
  - ab joined [5 min]
- Joining
  - abc joined [6 min]
- Rotating
  - Table rotated [2 min]
  - Loading
    - Part unloaded [3 min]
  - Rotating
    - Table rotated [2 min]
  - Loading
    - Finish

Legend:
- TTF = time to fulfil
- Parallel decomposition
- Sequential decomposition
**MOISE Organisation: Normative Specification**

4.2 Agent Programs
4 An Example in JACAMO
4.2 Agent Programs

Plans to Facilitate Interaction with MOISE and CARTAGO

- JASON plans available with JACAMO which facilitate interaction with MOISE and CARTAGO when programming the agents

Example 4.1

Generic Plan for Agents that are part of an Organisation

// obligation to achieve a goal
+obligation(Ag,Norm,achieved(Scheme,Goal,Ag),Deadline) :
  .my_name(Ag) <- !Goal[scheme(Scheme)];
  lookupArtifact(Scheme,Id);
  goalAchieved(Goal)[artifact_id(Id)].
Plans to Facilitate Interaction with MOISE and CARTAGO

- JASON plans available with JACAMO which facilitate interaction with MOISE and CARTAGO when programming the agents.
- Some such plans appear in file common.asl.

Example 4.1

Generic Plan for Agents that are part of an Organisation

```prolog
// obligation to achieve a goal
+obligation(Ag,Norm,achieved(Scheme,Goal,Ag),Deadline) :
  .my_name(Ag) <-
    !Goal[scheme(Scheme)];
  lookupArtifact(Scheme,Id);
  goalAchieved(Goal)[artifact_id(Id)].
```

R. Bordini, J. Dix · Chapter 13: Multi-Agent Systems, Ed. G. Weiss
Explanation of the Previous Plan

- That plan says that whenever the agent comes to believe that it has a new obligation towards an organisational goal $\text{Goal}$ (note the use of JASON higher-order variables here), it just tries to achieve that goal.
4 An Example in JACAMO
4.2 Agent Programs

Explanation of the Previous Plan

- That plan says that whenever the agent comes to believe that it has a new obligation towards an organisational goal $\text{Goal}$ (note the use of JASON higher-order variables here), it just tries to achieve that goal.

- If all goes well, the agent tells the organisation, through an ORA4MAS artifact, that the goal it was obliged to achieve has been achieved (this is important so that the organisation can then delegate further goals to be achieved, possibly by other agents).
In this application, the actual behaviour for agents “loader”, “joiner”, and “flipper” is to simply adopt its predetermined role and then do whatever it is asked to do.
Simple Controller Agents II

- This is possible because the name of such operations in the artifact simulating the manufacturing cell is the same as the goal itself.
- Artefact operations automatically become external actions for the JASON agent to use in plans.
- This can be done in a generic way (through the use of the higher-order variable $G$ below), for any organisational goal received.
Simple Controller Agents III

- Initially the agent joins the ORA4MAS workspace so as to take part in the organisation, then it also needs to focus on the ORA4MAS organisational artifact so as to automatically perceive information about the group such as newly created schemes.

- The agent then adopts a role in the group (the group and specific role for each of the three agents using this code are specified as initial goals in the JASON project file).

- This is the complete code for the simpler agents:
Simple Controller Agents IV

// Join the organisation and play a role in it
+!join_and_play(GroupName, RoleName)
  <- !in_ora4mas;
    lookupArtifact(GroupName, GroupId);
    focus(GroupId);
    adoptRole(RoleName)[artifact_id(GroupId)].

// Then, just do whatever told by the organisation
In the MOISE scheme for the manufacturing process, the rotator is assigned two different goals: to wait for an empty jig and to get the table rotated.
The Rotator Agent II

- They check the number of instances of the manufacturing scheme in MOISE so as to check if there are 1 or 2 concurrent orders being manufactured by this cell (each order is handled by one scheme instance).
- The name of the scheme that requested the achievement of a particular goal is annotated in the new goal events.
The Rotator Agent III

// rule to check if we have two concurrent orders (2 Moise schemes)
two_orders :- schemes(L) & .length(L)==2.
// or only one order so far
one_order :- schemes(L) & .length(L)==1.

// 1st organisational goal of the rotator (wait for empty jig)

// avoid conflicts when 2 orders are simultaneously waiting for empty jigs
%!wait_for_empty_jig[scheme(S1)] :
    .desire(wait_for_empty_jib[scheme(S2)]) & S1\==S2 <-
    .wait(500); // wait a bit
    !wait_for_empty_jig[scheme(S1)]. // and try again

// already got an empty jig
%!wait_for_empty_jig[scheme(S)] :
The Rotator Agent IV

jig_loader("empty") <-
    reserve_jig(S). // make sure another order doesn’t get it too

// will have to wait until the jig at the loader end is empty
+!wait_for_empty_jig[scheme(S)] <-
    .wait({+jig_loader("empty")}); // wait until this event happens
    reserve_jig(S); // make sure empty jig is allocated to this order
// if there are pending requests to rotate the table
if (.desire(table_rotated[scheme(S)])) {
    // might need reconsidering which plan to use for rotating
    .drop_desire(table_rotated[scheme(S)]);
    !!table_rotated[scheme(S)];
}.

// 2nd organisational goal of the rotator (rotate table)
The Rotator Agent V

// Only 1 assembling task, rotate whenever asked
+!table_rotated : one_order <- table_rotated.

// Let it rotate if another job needs it and we’re waiting for an empty jig
+!table_rotated :
  two_orders & .desire(wait_for_empty_jig) & not jig_loader("empty") <-
  table_rotated.

// If there are 2 concurrent assembling tasks, wait for both
// to want to rotate before actually rotating

// This is actually the second request to rotate
@tr[atomic] // both goals need to be considered achieved simultaneously
+!table_rotated[scheme(S1)] :
  two_orders & .desire(table_rotated[scheme(S2)]) & S1\==S2 <-
The Rotator Agent VI

table_rotated; // one rotation achieves both requests
.succeed_goal(table_rotated[scheme(S2)]).

// The first attempt just waits, 2nd request releases both
+!table_rotated[scheme(S)] :
  two_orders <=
    .wait(1000); // wait a bit
  !table_rotated[scheme(S)]. // try again
Cell Manager I

- The cell manager agent has mostly procedural code to create the simulation artifacts and initialise the organisation
Cell Manager II

Example 4.2

// each order generates an instance of the Manufacture scheme
@op1[atomic] // needs to be an atomic operation: changing the no. of schemes
+order(N):
    formationStatus(ok)[artifact_id(GrArtId)]
    & schemes(L) & .length(L)<=1 <- // no more than 1 order under way
    // wait until empty jig is correctly positioned at loader robor
    .concat("order", N, SchemeName);
    makeArtifact(SchemeName, "ora4mas.nopl.SchemeBoard",
        ["src/manufacture-os.xml", manufacture_schm, false, true], SchArtId);
    focus(SchArtId); // get all info about this Moise scheme
    addScheme(SchemeName)[artifact_id(GrArtId)].
Cell Manager III

The preceding plan accepts at most two concurrent manufacturing orders, and creates the necessary ORA4MAS scheme artifact to handle a new (simulated) manufacturing order.
4.3 Environment Program
Environment I

- A few environment artifacts were mentioned above
Environment II

- Of course CNP can also be managed directly by agents, as in the example given in [Bordini et al., 2007b, Section 6.3]

- There are some advantages of using the artifact-based implementation in this case

- For example it reduces the amount of direct agent-to-agent communication required and allows the use of CNP in open multiagent systems: when agents join a CARTRAGO workspace, they will be able to automatically perceive the available CNP instances and join in if they so wish
Environment III

- Even though it is not necessary to program the artifact in this case, we show the code of one of the artifacts (the task board) just to illustrate the environment side of the system.

- It also helps showing how artifacts are at a different level of abstractions as normal objects in Java.

- The observable properties and operations automatically become percepts/action available to all agents that enter the shared workspace.
Environment IV

- In the code for the task board (available at http://cartago.sourceforge.net), agents use the announce operation on this artifact when they wish to start a new CNP instance for a particular task.

- This artifact will then create another artifact to manage that particular instance of the CNP, with an observable property showing the task description (which again is accessible to any agents joining the workspace at runtime).
Environment V

- It is in that newly created artifact that agents will be able to bid, and the agent being awarded the contract will be announced there too.
new ArtifactConfig(taskDescr, duration));
    defineObsProperty("task", taskDescr, artifactName);
    id.set(artifactName);
} catch (Exception ex) {
    failed("announce_failed");
}

@OPERATION void clear(String id) {
    String artifactName = "cnp_board_"+taskId;
    this.removeObsPropertyByTemplate("task", null, artifactName);
}

Some Final Comments

- The slides only included excerpts, although all the important parts of the code were covered.
Some Final Comments

- The slides only included excerpts, although all the important parts of the code were covered.
- Best approach to understand this example is to look at the complete (fully commented) code and run the system.
Some Final Comments

- The slides only included excerpts, although all the important parts of the code were covered.
- Best approach to understand this example is to look at the complete (fully commented) code and run the system.
- The working example for one manufacturing cell can be downloaded from http://www.inf.pucrs.br/r.bordini/WeissBookChapter13Ex.
Some Final Comments

- The slides only included excerpts, although all the important parts of the code were covered.
- Best approach to understand this example is to look at the complete (fully commented) code and run the system.
- The working example for one manufacturing cell can be downloaded from http://www.inf.pucrs.br/r.bordini/WeissBookChapter13Ex.
- We leave as exercise to use the CNP artifacts for extending to multiple cells.
